

Customer Journey Map

Date	03 October 2026
Team ID	SWTID-2026-6385
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1	Stage 2	Stage 3
Actions <i>What does the customer do?</i>	• Create ServiceNow user • Create and assign required roles • Create Institution Details table and fields	• Configure READ ACL • Configure CREATE and WRITE ACLs • Apply branch-based access restriction	• Configure DELETE ACL • Test user access permissions • Verify complete project outcome
Touchpoint <i>What part of the service do they interact with?</i>	• ServiceNow User Administration • Roles • Institution Details table	• ServiceNow Access Control Lists • ACL scripts • Branch field / record access	• ServiceNow records • DELETE ACL • User impersonation / access verification
Customer Thought <i>What is the customer thinking?</i>	• Users and roles should be configured correctly. • The table should contain all required student details. • Access permissions should be based on user roles.	• Only authorized users should access the records. • EEE users should access EEE records. • Administrators should have full access.	• Users should only perform actions allowed by their roles. • Unauthorized users must not delete records. • The complete ACL setup should work as expected.

Customer Feeling <i>What is the customer feeling?</i>	• Expecting proper configuration • Careful about security • Confident after successful setup	• Concerned about unauthorized access • Secure when restrictions work correctly • Satisfied with role-based control	• Reassured after successful testing • Confident about record security • Satisfied with the final solution
Process Ownership <i>Who is in the lead on this?</i>	Yuvan Kumar S	Yadesh Kannan	U Sivapriyan
Opportunities <i>How can we improve this stage?</i>	• Clearly define required roles • Validate user and role assignments • Verify all table fields before proceeding	• Use clear ACL conditions • Validate script logic carefully • Test Read, Create and Write permissions	• Test all CRUD operations • Verify admin and user access separately • Document the final results and issues
