

Performance Testing

Date	03 October 2026
Team ID	SWTID-2026-6385
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Team Members	Shivani P; Sheerin Farhath; Seshriya; Shalini; Shanthini
Platform	ServiceNow Administrator
Maximum Marks	5 Marks

Performance Testing

For this project, the available evidence focuses on validating the behavior of the Script-Controlled ACL in ServiceNow. The submitted evidence does not contain a JMeter, Locust, k6, or similar load-test report, so numerical performance metrics such as throughput, CPU utilization, memory utilization, and response-time targets are not claimed as measured results. Instead, the testing record documents the actual ACL/security validation performed in the ServiceNow Administrator.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Administrator – built-in Access Control (ACL) configuration and security-rule verification
Type of Testing	ACL / security validation and functional access-control testing
Target Module / API	Institution Details table and its Access Control rules
Test Environment	ServiceNow Administrator instance
Test Date	02 October 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration	Expected Outcome
1	Validate that the Institution Details table has the intended ACL configuration.	N/A	N/A	Only authorized access rules are applied.
2	Verify the ACL required-role configuration for the protected resource.	N/A	N/A	Users without the required role are denied access.
3	Verify field-value/branch-based condition and advanced scripted condition.	N/A	N/A	Access is evaluated according to the configured condition/script.
4	Use ServiceNow security-rule verification to validate the configured ACL.	N/A	N/A	The configured ACL is recognized and evaluated by ServiceNow.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status	Remarks
1	Response Time (Avg)	Not defined	Not measured	N/A	No load-testing tool evidence was supplied.
2	Response Time (Max)	Not defined	Not measured	N/A	No load-testing tool evidence was supplied.
3	Throughput (Req/sec)	Not defined	Not measured	N/A	ACL validation was functional/security focused.
4	Error Rate	Not defined	Not measured	N/A	No load-test error-rate report was supplied.
5	CPU Utilization	Not defined	Not measured	N/A	No infrastructure monitoring evidence was supplied.
6	Memory Utilization	Not defined	Not measured	N/A	No infrastructure monitoring evidence was supplied.

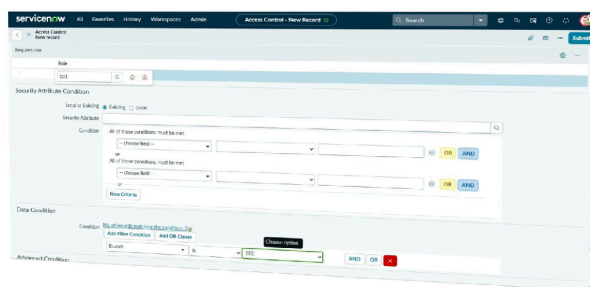

Step 4: Observations & Analysis

Key Findings	The ServiceNow evidence demonstrates creation/configuration of the Institution Details table and ACL rules. The ACL configuration includes required-role, condition, and advanced scripted-condition areas. ServiceNow security-rule verification screens were also captured.
Bottlenecks Identified	No performance bottleneck can be established from the submitted evidence because no load or resource-utilization measurements were provided.
Optimization Steps Taken	The implementation uses ACL conditions and scripted logic to control access based on record/field context. The security-rule verification feature was used to validate the configured rule.

Step 5: Screenshots / Evidence

Selected evidence from the team's ServiceNow implementation is shown below. The left panel shows the required role and Branch condition; the right panel shows the scripted access logic and security-rule verification.

ACL role + Branch condition

Script + security-rule verification

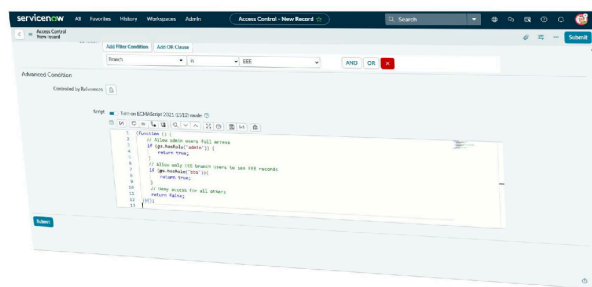

Figure 1. ServiceNow ACL implementation evidence.

Note: This document follows the supplied Performance Testing template while accurately recording the testing evidence available for the ServiceNow ACL project. No unverified numerical performance results have been inserted.
